

## QA Fixture Candidate (permanent, synthetic)

### Senior Engineer

This brief contains only claims drawn from interviewer-captured notes. Every claim cites a specific captured response. Argo does not score, rank, or recommend.

---

### Role context

This brief covers a Senior Engineer role (permanent position). Senior Engineers at this level are typically expected to lead complex technical projects, collaborate cross-functionally, and demonstrate strong engineering judgment. The responses captured reflect technical and interpersonal scenarios relevant to that scope.

### Technical Execution

Describes leading a migration off a legacy queue system, which they report took approximately six weeks. [\[1\]](#)

Reports pairing closely with two other engineers during the migration and writing a rollback plan before touching production. [\[1\]](#)

Says the migration shipped with zero downtime. [\[1\]](#)

Describes coordinating the cutover window with the on-call rotation as the hardest part of the migration. [\[1\]](#)

### Collaboration and Communication

Describes a situation where a teammate disagreed with their approach in a design review; reports asking the teammate to walk through their reasoning end to end before responding. [\[2\]](#)

Says the teammate's perspective revealed context about a downstream consumer that they had missed, and that they changed the interface together as a result. [\[2\]](#)

### Starred moments

Describes writing a rollback plan before touching production during the legacy queue migration, framing it as a deliberate step prior to any production changes. [\[1\]](#)

Reports actively soliciting a disagreeing teammate's full reasoning before responding in a design review, and updating their own technical decision based on the information surfaced. [\[2\]](#)

## Open questions for the team

1. Neither response addressed the questions actually asked (QBR facilitation; a customer loss post-mortem). Is the candidate aware of what was asked, and can they demonstrate the behaviors those questions target?
2. The legacy queue migration and the design review disagreement are the only two data points captured. Were other questions asked and not recorded, or was coverage limited to these two?
3. The candidate's responses do not surface any experience with stakeholder or executive communication. Is there evidence of that capability from other parts of the interview?
4. There is no response data on customer-facing experience, ownership of failures, or cross-functional influence. Should follow-up rounds probe these areas explicitly?
5. r1 describes a team effort but the candidate's individual scope and decision-making authority within it are not clear. How much of the migration did they own versus support?

Every claim above is retrieved from a specific interviewer-captured response and cited by number, drafted with claude-sonnet-4-6. Argo does not score, rank, or recommend candidates for hire, and does not infer protected characteristics from anything captured. Argo structures what was said. Humans decide.

## Cited responses

[1]

How do you run a quarterly business review that executives actually attend? What is on your agenda?

I led the migration off our legacy queue system over about six weeks. I paired closely with two other engineers, wrote a rollback plan before touching production, and we shipped it with zero downtime. The hardest part was coordinating the cutover window with the on-call rotation.

[2]

Describe a customer you could not save. Looking back, when was the save actually lost?

When a teammate disagreed with my approach in a design review, I asked them to walk me through their reasoning end to end before responding. It turned out they had context on a downstream consumer I had missed, so we changed the interface together.
